

## CSS Box Model Assignment - Day 5

**Objective:** Understand and practice the CSS Box Model and the differences between `border-box` and `content-box`.

---

### Instructions:

1. Create a webpage with the following elements:
    - A heading (`<h1>`) and a paragraph (`<p>`).
    - Three containers (`<div>`), each with a different background color.
  2. Style the elements using the **Box Model**:
    - Apply padding, margin, and borders to the containers.
    - Use `box-sizing: content-box;` for the first container and `box-sizing: border-box;` for the second container.
    - Leave the third container without specifying `box-sizing` to observe the default behavior.
  3. Add text inside the containers and check how the `box-sizing` affects the overall width and height.
- 

### Bonus Task (Optional):

1. Add a hover effect to change the background color of the containers.
2. Experiment with different border styles (solid, dashed, dotted) and widths for the containers.
